

Domain Names

What is a Domain Name ? A Domain Name is used to identify the location of a Website on the Internet.

You link your Website to your Domain Name so people can find your web pages.
(like the way people find your business premises using your street address)

Your Web address is called a universal resource locator or URL - this would look something like www.mydomain.com.au If you are going to mount pages on the internet it is a good idea to have your own domain name as this gives you a unique and distinct web presence. Using a Domain Name ...

You can promote your presence on the internet by registering a domain name. Used in conjunction with Web Hosting the Domain is important as it forms parts of your web and email address - i.e. you can send and receive email and access web pages using your own domain name.

Example: A business with the registered business name Vorgan's Organic Produce and the registered domain vorganic.com.au can set up mail boxes like: sales@vorganic.com.au and info@vorganic.com.au and have their web pages accessed via the address www.vorganic.com.au

If your present web or email address is based on the name of your Internet Service Provider (ISP) it makes it difficult for your customers to remember your Internet Address as these type of names are usually longer and more cumbersome.
e.g. www.myispbusinessname.com.au/myusername/files.htm

Domain Name Prices:

. All prices are in Australian Dollars (AUD) . #.com.au / .net.au / .org.au \$100.00 for 2 years.com / .net / .org \$ 50.00 for 2 years
